(a) Drift relative to sampling noise
Standardised drift |ΔlogOR| / SE(difference)
z = 1.96 (sampling-noise bound)
same endpoint across release
same release different endpoint
across both
(b) Case-count change vs effect drift (n=55)
Spearman ρ = 0.335
permutation P = 0.015
|Δ logOR|
|Δ log(public case count)|
